

SPECIMEN NO. 01 – FOR THE DISCERNING OPERATOR

IMPRESSION

A specimen of everything this press can print.

ENGINE

Typst 0.15 – vector

INKS

5 spot + key

FINISH

pypdf post-press

Contents

03	The Ink Library Spot-color swatches, coverage, and mixing table.	
04	Halftones & Gradients Vector dot grids and linear / radial / conic fills.	
05	Data, Plotted Bar, line, and donut — drawn as pure vector.	
06	The Press, Diagrammed Ink path from source to sheet, as a flow.	
07	Registration & Overprint Trapping, misregistration, and knock-out.	
08	Quality Control Sign-off form and colophon.	

ESTIMATED INK COVERAGE, THIS IMPRESSION

 Pink 34%

 Blue 28%

 Yellow 16%

 Green 14%

 Key 8%

Five inks, and the black.

Each ink is a solid spot color laid straight onto the stock. The house standard is six drums; every color on later plates is one of these, screened or overprinted. Swatches below carry their build value and paper reserve.

OVERPRINT MIXING – TWO INKS,
ONE PASS

BASE	SCREEN	RESULT
Yellow	Pink	
Blue	Pink	
Yellow	Blue	
Green	Pink	

Dots do the shading.

There is no grey ink. A tone is a field of dots whose radius rises with demand — computed and drawn as vector, one circle at a time. Gradients are the smooth cousin: the same math, resolved continuously.

HALFTONE RAMP — 24 × 8 CELLS, RADIUS BY COLUMN

CONTINUOUS FILLS

linear · blue→pink, 45°

radial · yellow core→green

conic · full ink wheel

SCREENED STEPS — 10% INCREMENTS

10

20

30

40

50

60

70

80

90

100

Numbers, given ink.

No plotting library ran here. Bars are boxes, the line is a curve(), the donut is concentric arcs — all laid out in flow, all sized from the data below. Impressions pulled, by month.

IMPRESSIONS PULLED — THOUSANDS / MONTH

REGISTRATION ACCURACY — MICRONS OFF

Lower is tighter. Target $\leq 5 \mu\text{m}$ by run's end — met.

SHEETS BY GRADE

Grade A 62%
Grade B 24%
Grade C 14%

Source to sheet.

How a page becomes an impression. Nodes and connectors are laid out on a grid with 1fr gutters — no eyeballed offsets, so the arrows always meet their boxes.

INK PATH — ONE DRUM, ONE PASS

Where inks meet.

Two drums never land in exactly the same place. The craft is in the seam: overprint to hide it, trap to bridge it, knock out to keep colors pure. Three studies, each a live composite.

In register

Overprint mixes to a third color.

Misregister

Drums off by 3 mm – a paper seam shows.

Knock-out

Base punched away; top ink prints pure.

TRAP GAUGE – SPREAD IN POINTS

A trap overlaps the lighter ink into the darker by a hair, so a slight misregister still shows no paper. House default: 0.5 pt.

Signed off the press.

Every impression carries a sign-off. The boxes below are drawn as an interactive proof — the same document can be printed as a form (see the press's forms module) or stamped and locked in post.

PRESS CHECK

- ☒ Registration within 5 μ m
- ☒ Solid density on target
- ☒ No banding in gradients
- ☐ Deckle edge trimmed

BINDERY

- ☒ Page sequence verified
- ☒ Bookmarks embedded
- ☐ Cover laminated
- ☐ Shrink-wrapped

SIGN-OFF

J. Rivera

RUN №

Colophon

This specimen was set and composed entirely in **Typst 0.15**, which resolves every rule, dot, ramp, arc, and chart on these pages to pure vector — no image was placed. It was then run through **pypdf** in post-press to stamp a proof mark, write document metadata, and stitch the outline you can navigate at left. Rendered and verified page by page before release.

SPECIFICATION

FORMAT	A4 · 210×297
